Discussion

The stock prices of BAC and MS are well correlated. This observation is supported by the similarity of defining CPIs with equal time lags. It is worth noting that the level of correlation may cease quickly for two models with the same defining CPIs but with increasing difference in time lags. For the same CPIs and lags, the level of correlation depends on the ratio of CPI coefficients. This ratio (b_1/b_2) is -2.23 for BAC and -1.65 for MS. The closeness of the ratios guarantees similar evolution of their prices. It is important to stress, however, that *SEFV* has a
